

## How to use the knob combiners on the Quattro Pro

The knob combiners enable the Quattro to become a two or three lever quadrant. For a two lever combination, you use both knob combiners. For a three lever combination( think of an B727), use only one knob combiner.

Each throttle lever has two holes. The hole on the left side of the knob is threaded, and the hole on the right side of the lever is hollow. ***The threaded hole is always located on the left side of the knob.*** The knob combiner has a threaded rod. The idea is simple. You screw one end of the combiner into the threaded hole, and let the other side of the combiner slip into the hole of the adjacent lever. The adjacent lever needs to be pushed out just enough for the threaded rod to pass by until it reaches the hole.

In the Flight Simulator, you must disable the unused axis.
